01 / The map is the stage.

Keep the 3D geographic visualisation. Give the controls a quieter, more tactile frame. This is a visual specification for an existing application, not a new website build.

What to carry over from the references

Warm white surfaces; large, restrained corners; a fine edge highlight; wide spacing; dark neutral typography; understated amber indicators. Use a serif only for a question, quotation or empty state.

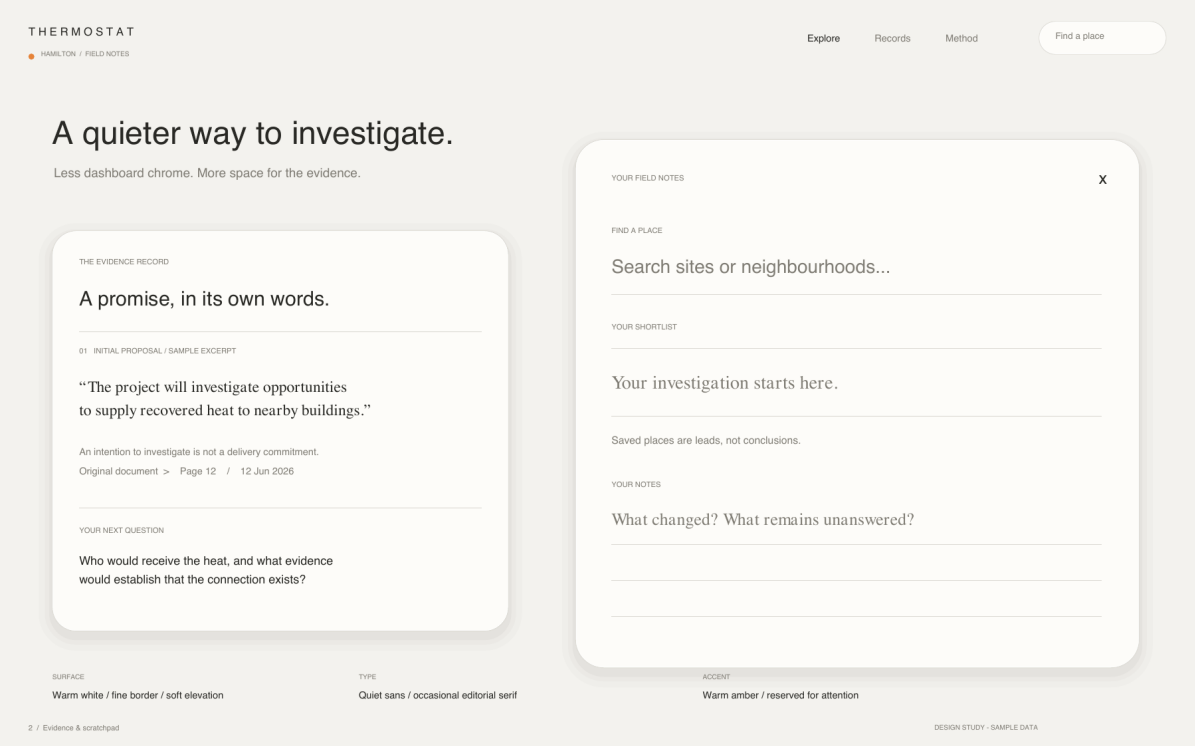

The ThermoStat adaptation

A floating left rail handles location, layers and site selection. A floating right card handles the selected site. The middle remains available for the map and connections. Numbered evidence rows replace the previous dashboard badges and score bars.

Map visibility comes first

At desktop widths, keep the left rail around 260-280 px and the right card around 380-420 px. Use 24-32 px outer gutters. Offset the camera or fit bounds with panel padding so the selected source is never hidden underneath a card.

02 / Evidence deserves space.

Overlay behaviour

Use a compact facility header followed by three accordion rows. Start with heat reuse expanded. Show summary, evidence status, original source and a question to follow. The record panel replaces or expands the facility card; avoid stacking several large overlays.

Field notes

A separate panel holds a shortlist and private working notes. The screenshot is a design target; the provided FieldNotes component covers the textarea only. Search, shortlist persistence, closing, focus management and API saves belong in the host application.

Responsive layout

Below 1024 px, collapse the left rail into a Places button. Below 640 px, use one bottom sheet with a visible grabber and explicit close action; cap it at about 62% of viewport height. Keep the selected location visible above it. A modal must trap focus, close with Escape and return focus to its trigger.

Motion

180-220 ms opacity and 6 px translation on panel entry. No bouncing cards, continuous arc animation or decorative counters. Honour prefers-reduced-motion.

03 / Visual implementation.

The files your teammate should use

tokens.css - Surface, typography, spacing, accordions, buttons and notes styling.

FacilityPanel.tsx - A reusable facility overlay and a controlled FieldNotes textarea.

data-contract.ts - Suggested typed objects for facilities, evidence records and connections.

map-layers.ts - A deck.gl layer adapter for selected-site arcs and endpoints.

Mount the overlay in the existing map shell

```
<div className="facility-position">
  <FacilityPanel
    facility={selectedFacility}
    onOpenEvidence={openEvidence}
    onSaveNote={openNotes}
  />
</div>

.facility-position {
  position: absolute; top: 24px; right: 24px;
  z-index: 10;
}
```

Small decisions that define the style

Use 28 px panel padding, a 30 px main corner radius and a subtle two-part shadow. Body text should generally stay at 13-15 px; metadata at 11-12 px; section labels at 10-11 px. Avoid pale grey body copy. Use at most one dark primary button in a panel.

Load an existing project sans font first. The CSS falls back to system fonts. Reserve the serif for a short human question or source quote. Use a real icon set already in the project instead of emoji or improvised symbols.

Colour is supplemental

Do not imply compliance with a red/green pill or a numeric completeness score. Print the evidence status in words. Amber calls attention; muted lilac is a secondary connection colour. Both remain labelled in the legend.

04 / Connect it without guessing.

Backend-to-frontend responsibilities

Backend: source documents, exact excerpts, dates, facility identities, coordinates, evidence status and verification provenance.
Frontend: selected facility, visible layers, expanded rows, panel state, readable legends and explicit loading/error feedback.
Notes: private working context, persisted separately from evidence.

Map integration

```
const visibleConnections = connections.filter(
  item => item.facilityId === selectedFacility.id
);
const layers = makeHeatLayers(visibleConnections, {
  visible: showHeatConnections,
  onSelect: openConnectionDetails
});
// Feed layers to the existing deck/map overlay.
```

Use longitude, latitude ordering. Arc width is decorative unless a real measurement and unit are supplied. Scenarios, proposals and operational links need explicit labels; do not treat an arc as a measured pipe route. Keep the basemap neutral and buildings desaturated. A 45-55 degree pitch is a starting point, not a locked camera.

Required states before handoff is complete

• Loading: show a short skeleton or text, never fabricated values.

• Empty: say which records are missing; provide a useful next action.

• Error: keep the map usable and show a retry action inside the panel.

• Selection: switch the card and map highlight together.

• Source: show document date, retrieval date, exact excerpt and page when known.

• Notes: distinguish unsaved, saving, saved and failed; do not silently lose text.

• Accessibility: keyboard navigation, visible focus, labelled controls and readable contrast.

Scope and verification

The PNGs and vector PDF are visually reviewed design studies. The React/TypeScript examples are integration scaffolds; they have not been compiled against your teammate's repository. The city geometry, facilities and records in these mockups are illustrative. No live backend or Backboard calls are included.
